The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprisaing a sequence of REL-A gene, in the presence of a divalent cation, especially MG^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, colorectal, as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, genicitabline or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as colosis, aschmanial/reperfusion injury (central nervous system (CNS) and mycoradial), glomerulonephritis, respense to inflammatory bowel disease or infection. This sequence represents the substrate of a novel
               gemcitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn's disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion inlury; glomerulomephritis; allergic airway inflammation; inflammatory bowel disease; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel enzymatic nucleic acid molecules which down regulates expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases

Draper KG;

WPI; 2003-340953/32.

Claim 3; Page 40; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, head and neck, ovarian cancer, melanoma, lymphoma, glioma or cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-Aspecific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, captures or chemmatoid arthritis, restenosis, asthma, crohm's disease such as consity, autoimmune disease, lupus, multiple sclerosis, transplant/graft crejection, gene therapy application, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, cespesis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel

enzymatic nucleic acid molecule.

antisense nucleic acid molecules are useful for treating breast, lung,

ö

```
The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2^+. The enzymatic and

prostate, colorectal, brain, despendent, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glloma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edertexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such a rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, septence represents the substrate of a novel enzymatic nucleic acid molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a screening method for selecting compounds and their salts inhibiting the expression of core binding factor alpha subunit 1 (CBFA1) type II, by measuring the amount of mRNA encoding CBFA1 type II exon 0 present in cells expressing CBFA1, in the presence and absence of the test compound. CBFA1 has cytostatic activity. The method can be used for the treatment, prevention and diagnosis of cancer (including cancer of the colon, breast, lung, prostate, oesophagus, liver, gall-bladder, spleen, kidney, pancreas, uterus, testis, thyroid, bladder or brain, and leukaemia) and inhibition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screening compounds inhibiting expression of core binding factor alpha subunit 1 type II for prevention and treatment of cancer and metastasis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel short interfering RNA (SiRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HRE2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in AEES9889 - AEEG6516, AEEG444 - AEEG531, AEEG6520 - AEEG6524. AEEG6531, and AIDS sequences for the human ribozymes of the invention.
of cancer proliferation and metastasis. The present sequence represents a PCR primer for human CBFA1 type II, which is used in an example from the present invention.

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HRR2. K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-Heumatic activity. The nucleic acid molecules are useful for reducing HRR2. K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ65216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66520 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule encoding HER2, K-Ras, H-Ras, M-Ras, and in-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ25889 - ABZ66516, ABZ66531, ABZ66530 - ABZ66516, ABZ66531, and AIDS. sequences for the human ribozymes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel short interfering RNA (siRNA) nucleic
                                                                                                                                                                                                                                                                                                          Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, ribozyme, short interfering RNA, siRNA, HER2, K-Ras,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and acid molecule of the invention has cytostatic, anti-HIV, and arti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABES6989 - ABEZ65216, ABEZ65231, ABEZ6520 - ABEZ65285 represent substrate/target sequences for the human ribozymes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HRR2, K-Ras, H-Ras, N-Rahuman immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-Heumatic activity. The nucleic acid molecules are useful for reducing HRR2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ5989 - ABZ65816, ABZ65531, ABZ6520 - ABZ65850 - ABZ6585 represent substrate/target sequences for the human ribozymes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences

expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic canner, and HIV infection, and AIDS. The sequences shown in ABZ53989 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66585 represent substrate/target sequences for the human ribozymes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is an antisense molecule directed against position -9 to +9, relative to the start codon of the gene for mouse fibroblast growth factor 1. The polymucleotide can be used for inhibiting vascular smooth muscle cell proliferation and for treating a disease e.g. vascular stenosis, post angioplasty restenosis, atherectomy, atherosclerosis, atrial venous shunt failure, cardiac hypertrophy, vascular surgery and organ transplant.
                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Primer 1 and 2 (AAQ86978-79) were used to amplify a target nucleotide sequence from methicillin resistant S. aureus (MRSA). The target is detected with a probe specifically derived from the mech gene of S. aureus and S. epidermidis. The mech gene product has no homology with known PBPs (penicillin-binding proteins). The new probes allow for the rapid identification of all MRS, eradicating need for labour intensive in vitro cultivation and physiological assays.

AAT50699-T50754 represent target sequences for the rabbit cholesterol ester transfer protein (CETP) hairpin ribozymes (see AAT50643-T50698).

CETP is a 74 m Glycoprotein that facilitates neutral lipid transfer to be between plasma lipoproteins. The numbering of the targets refers to binds to 4-6 mucleotides 5', and a variable number 3' of this site. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or bliminated) thereby preventing the reduction in size density of the high density lipoproteins (HDL), prolonging HDL half life, and therefore increasing HDL levels. The ribozymes can be used to treat conditions consisted with abnormal levels of CETP, specifically atherosclerosis; peripheral vascular disease, hyporbetalipoproteinaemia, vascular complications of diabetes, transplant, atherectomy and angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and a corresponding increase in HDL levels). The ribozymes can also be used diagnostically to study genetic drift and material and in diseased cells, and to detect CETP mRNA, As the ribozymes can also be used diagnostically to study genetic drift and material and material and the ribozymes can also be used diagnostically to study genetic drift and material and the ribozymes can also be used diagnostically and the ribozymes can also be used diagnostically the ribozymes for the ribozymes can also be used diagnostically and the ribozymes can also be used diagnostically to study genetic drift and material and the ribozymes can also be used diagnostically and the ribozymes can also be used diagnostically the ribozymes and the ribozymes can also be used diagnostically and the ribozymes can also ribozymes can also be used diagnostically and the ribozymes can also ribozymes can also be used diagnosticall
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Primer ES11 (AAT30032) is based on the conserved amino acids CEGCKA(G) of the DNA binding domain of a typical nuclear receptor. It was used with antisense primer ES15 (AAT30034) for the PCR amplification of human colMa prepd. from osteosarcoma SAGS-2/B10 cells. A second round of PCR utilised primers ES12 (AAT30033) and ES15. A product was obtd. that was used to screen the osteosarcoma ibitarry, resulting in isolation of a clone (AAT30031) coding for a novel steroid hormone receptor, NER (AAR98140).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              are oligonucleotides of the invention. These sequences can be modified to become more nuclease resistant, using phosphorothicate, problem modified links. To screen for modified mustile sequences that inhibit cell proliferation, cultured smooth mustile cells that are arrested in the GO phase, are induced to proliferate in the presence of the multi-G sequence. The cultured smooth muscle cells used in this method are attraction medium, followed by transfer to a normal growth arrest is achieved on a starvation medium, followed by transfer to a normal growth medium to induce proliferation. The compounds that provide over 50% inhibition at a set dosage are selected as being useful for inhibiting vascular restencis. The multi-G oligonucleotides are used to inhibit proliferation of smooth muscle cells, such as to prevent
                                                   Multi-G oligonucleotide; antisense sequence; c-myb; nuclease resistant; phosphorothioate linkage; phosphorodithioate linkage; inhibitor; therapy; cell proliferation; smooth muscle cell; proliferation protein; vascular restenosis; arterial restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           arterial restenosis. These sequences are not antisense sequences, but are thought to work in a similar way. The sequences are thought to act by binding to proteins involved in the proliferation process. Compounds containing these multi-G oligonucleotides are not toxic, and their effect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAT28317-T283347 represent multi-G oligonuclectides. AAT28332-T28335 are multi-G oligonuclectides with inosine substitutions. These sequences are oligonuclectides of the invention. These sequences can be modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New modified oligo:nucleotide(s) contg. consecutive guanine residues - inhibit proliferation of smooth muscle cells, esp. to prevent arterial restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient freeferby human) having a condition associated with the level of the fms-like tyrosine kinase i (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Maize, corn, Zea mays, delta-9 desaturase, GBSS, target, substrate, granule bound starch synthase, hammerhead ribozyme; hairpin ribozyme; modulation; gene expression; transgenic plant; cleavage; canola plant; caffeine synthesis; coffee plant; nicotine production; tobacco; fruit ripening; flower pigmentation; lignin production; ss.
                                                                                                                                                                                                      Nucleic acid molecule modulating VEGF receptor(s) gene expressimRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Granule bound starch synthase hairpin substrate SEQ ID NO:609.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ribozyme which modulates plant gene expression - preferably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 18;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 12.8; DB 1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fins-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid archritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX6775 to AAX7575 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vascular endothelial growth factor receptor; VEGF receptor; flt-1; tDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .,

                                                                                                        with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (1) can be used to modulate expression of a gare, in a plant (preferably a maize or canola plant). (1) can be used to modulate expression of a gare, in a plant (preferably a maize or canola plant). (1) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, chrysanthemum or marigold plant or lignin production in a tobacco, separation or plant or pine plant or lignin production in a tobacco,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Maize; corn; Zea mays; delta-9 desaturase; GBSS; target; substrate; granule bound starch synthase; hammerhead ribozyme; hairpin ribozyme; modulation; gene expression; transgenic plant; cleavage; canola plant; caffeine synthesis; coffee plant; micotine production; tobacco; fruit ripening; flower pigmentation; lignin production; ss.
                                                                                             present invention describes an enzymatic nucleic acid molecule (I)
                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ribozyme which modulates plant gene expression - preferably modulates expression of DELTA-9 desaturase or granule bound starch
modulates expression of DELTA-9 desaturase or granule bound starch
                                                                                                                                                                                                                                                                                                                                                                                      .

A novel method has been developed for identifying an unknown allele of a polyalielic gene. The method involves: (a) contacting the unknown allele with a panel of probes, each of which recognises a sequence motif that is present in some alleles of the polyalielic gene but not in others; (b) observing which probes recognise the unknown allele so as to obtain a fingerprint of the unknown alleles. The present sequence represents a specifically claimed probe for use in the method where the polyalielic with fingerprints of known alleles. The present sequence represents a specifically claimed probe for use in the method where the polyalielic of comparing the nummalian MHC genes is gene is a human leukocyte antigen class I gene. The method can be used for gene is a human leukocyte antigen class I gene. The method can be used for genes such as mammalian MHC genes, in mammals, TAP, LMP, ras, conclassical HAA class I genes, human complement factor genes C4 and C2, and the HAA complex, and genes located in mitochondrial DNA, bacterial chromosomes and viral DNA. The method is particularly useful for matching the alleles of the HAA genes in a prospective donor and a prospective recipient in tissue or organ transplantations. The method can also be used in paternity testing, in forensic medicine, as a

follow up technique in treatment of haematological malignancies or inherited disorders, in adoptive immunotherapy, and in identification of bacteria and viruses. The method can provide for the identification of alleles of the polyallelic genes using a limited number of selected recurring motif probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide the specific for the human endothalin. The method can be used to treat alrway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients

AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human genome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forenaics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, typerropley, Wiskott-Aldrich syndrome, Pabry's disease, familial hypercotholesterolemia, polycystic kidney disease, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Bilers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, andurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

AAV35388-V35414 are primers used in a method which results in a recombinant vaccinia virus comprising of a gag gene from a retrovirus such as HIV-1 or HIV-2, fused to a DNA fragment containing an epitope region (30-300 bases in length) of a retroviral gene other than the gag gene may be altered so as to produce a gag protein modified from the natural sequence by the addition, deletion or substitution of at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hypervariable region; ENV protein; vaccinia virus; gag gene; retrovirus; vaccines; infection; protection; primer; ss.
                                                                                                                                                                                                                                                            This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant vaccinia virus containing fusion HIB gag gene -
production in host cells of gag protein for use as vaccine
                                                                                                                                                                    Novel apoptosis-related DNAs and proteins - for diagnosis, preventing or treating diseases associated with apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                    0.9%; Score 12.8; DB 1; Length 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the synthesis and/or expression of interleukin (II)-ZR gamma encoded RNA. AAV93889 to AAV94574 represent specifically claimed ribozymes, and AXV94575 to AAV93526 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce tolerance in a recipient to alloantigen from a donor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present sequence invention describes ribozymes targeted to modulate

least 1 amino acid residue. The fusion gene is inserted into a region of a vaccinia virus not essential to its propagation, to give a recombinant vaccinia virus vector which is used to transform a host cell (such as Hela, Vero, VEF, rabbit kidney RK13 or human myeloma TK-143 cells). Upon culturing the host cell produces particulate structures containing the pusion aga protein. The recombinant vaccinia virus or the fusion gag protein and be used in the production of vaccines for protecting against infection with retroviruses such as HIV. 88888888888888

genes encode a gircerophosphodiester phosphodiesterase (Gpd), and proteins with homology to major outer sheath D15/oma87 homologue, and proteins with homology to major outer sheath (Msp) proteins of i denticola. Also described are: (1) an isolated protein capable of inducing a protective immunologic response to in an effective amount to an animal host; (2) a method of identifying a T. p. pallidum vaccine candidate; (3) a method of inducing a protective immune response against T. pallidum; (4) a method for analysing a sample of DNA to determine whether it originated from analysing a sample of DNA to determine whether it originated from analysing a sample of DNA to determine whether a first and a second clinical isolate of T. p. pallidum are the same or different. The clinical isolate of T. p. pallidum are the same or different. The clinical isolate of T. p. pallidum are the same or different. The clinical diseases, e.g. syphilis, bejal, pinta, yaws, gingivitis, and periodontal diseases. The methods may be used to identify vaccine other Treponemal diseases. The methods may be used to identify vaccine The present invention describes novel Treponema pallidum genes. These

Identifying compounds which modulate expression of nucleic acids, used to provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity

Example 21; Page 100; 264pp; English.

the expression of a target nucleic acid (tNA) sequence via binding of the expression of a target nucleic acid (tNA) sequence via binding of the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria. Also described are: (1) a method of tNA sequence via binding of the own with the tNA sequence comprising a tNA sequence via binding of the ONS with the tNA sequence comprising a tNA sequence via binding of the own with the tNA sequence comprising criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined phinding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from a ssays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. and proteins. When the CGICE gene is mutated it is responsible for best's macular dystrophy (BMD). Polynucleotides encoding CGICE are useful for diagnosing whether a patient carries a mutation in the CGICE gene. Normal and mutated CGICE proteins are useful for in order identifying activators and/or inhibitors of these proteins, in order to treat BMD. The CGICE gene offers a simpler and cheaper method of diagnosing BMD without the need for the presence of the patient. The gene may also be useful to discovering the genetic cause of age-related macular dystrophy. The present sequence represents a PCR primer for the human GCICE CDNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cute asthma, allergy, asthma, impeded respiration, respiratory distress syndrome; pain, cystic fibrosis, pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes human and mouse CGICE polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense oligonucleotide, multiple target, antisense treatment, impaired respiration, inflammation; lung disease; pulmonary vasoconstriction; inflammation; allergic rhinitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides antisense compounds of 8-30 nucleotides that inhibit the expression of human Cellular Inhibitor of Apoptosis-2 (c-1AP-2). The antisense compounds may be used for diagnostics, therapeutics (for modulating the expression of c-1AP-2), prophylaxis (e.g. to prevent or delay infection, inflammation, or tumor formation, as research reagents (e.g. to distinguish between members of a biological pathway) and in kits Sequences AAZ22103-142 represent phosphorothhoate ollopouncleotides used for antisense inhibition of cellular inhibitor of apoptosis-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense compounds complementary to Cellular Inhibitor of Apoptosis-2 useful for e.g. diagnostics, therapeutics, and as research reagents -

inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphonas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX5272-74. These multiple target antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and
colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis; prostate cancer; ss.

(first entry) 05-JUL-1999

Human endothelin-1 antisense oligonucleotide fragment.

Antisense oligonucleotide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasoconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; MAMAKAKEKEKEKEKE

```
The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, coding and concoding regions of the sequence of intiation codons, genomic flanking regions, intron-exon borders, the initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding protectins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides capecifically AAX5180-271 on be used for the capprocleotides (specifically AAX5180-271) can be used for the cancer conditions are those associated with impaired respiration and including lung diseases, pulmonary vasoconstriction, impeded inflammation, including lung diseases, pulmonary vasoconstriction, conditions, allergic rhinitis, acute ashima, allergies, asthma, impeded the sepiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary disease (COPD), and cancers such as leukemias, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancrearic cancer, hepatocellular carcinoma, which may metastasize the particular sail as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer.
pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; brast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Replication-competent; Sabin type 1 poliovirus vector; cloning site; 3C-protease cleavage site; mucosal vaccine; infectious disease; AIDS; human immunodeficiency virus type 1; HIV-1; small pox; poliomyelitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides used in treatment of, e.g. pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

                                                                                                                                                                                                                                                         The invention relates to a replication-competent recombinant Sabin type 1 poliovirus vector encoding a multiple cloning site and 3C-protease cleavage site between the two end N-terminal residues. This comprises a vector containing an exogenous vaccine gene at the multiple cloning site. A method of production of both vectors is also provided. The recombinant number of infectious diseases, including human immunodeficiency virus type 1 (HIV-1) (which causes acquired immunodeficiency syndrome (AIDS)), small pox, poliomyelitis and Hepatitis C. The poliovirus-mediated mucosal vaccine vectors overcome the diseavantages exhibited by Mahoney vectors by being safe to humans, replicable (having equal replication ability to that of the wild type) vectors, where the introduced vaccine genes are

proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase (SX). The products can be used for diagnosis and therapy. AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ6579 to AAZ740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmacceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaccutical agents acting on a disease as well as other

Novel biallelic markers used to construct a high density disequilibrium map of the human genome

Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -

WPI; 2000-679539/66.

           AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to PAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of
                                                                                                                                                                   pharmaceutical agents and diagnostic methods, as well as the charmacterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides and compositions (I) compared to alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and cativity of target polypeptides associated with a lung/respiratory disorders and malignancies, such as stimulating and chief receptors and antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, immunoglobulins and antibody receptors, bradykinin receptors, entral chemokines, adenosine receptors, bradykinin receptors, central nervous system (CKS) and peripheral nervous and non-nervous system peptide transmitters, defensine, growth factors, vasoactive peptides and receptors, bradykinin receptors, bradys proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergic system and proteins as and malignancy associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergic system (CKD), pain, cystic fibrosis (CF), allergic rhintis (RR), pulmonary hypertension, emphysema, chronic obstructive pulmonary infections, bronchitis, and/or cancer Abrila to Abrila are present hymen production. and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of the present invention.

Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -

Claim 14; Page 242; 1592pp; English.

in present invention describes for adenosities (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiathmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with ung/respiratory disorders and atribody polypeptides associated with activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoonstriction) and/or lung inflammation, allergy(ies) and/or bronchoonstriction) and/or bronchoonstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiratory pulmonary disease (COPD), pain, cystic fibrosis (CP), allergic rhinitis (RN), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pain, cystic fibrosis (CP), allergic rhinitis (RN), pulmonary and/or candor candor and/or and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of content antisense The present invention describes low adenosine (A)

The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDKI, PCNA and Cyclin B1
                                                                                                                                                                                                                                                                                                                                                                                               Ribozyme; hairpin; hammerhead; gene therapy; vasotropic;
                                                                                                                                                                                                                                                                                                                                                                             Cdc 2 kinase hammerhead ribozyme recognitoin site #50.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 1; Page 19; 109pp; English.

Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restrenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    o;
                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA8215 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment.
                                                                                                                                                                                                                                             New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

AAA29110-11 are primers, which can be used to clone an eosinophil-specific promoter (e.g. AAA29109) from the 5' flanking sequences of genomic cosinophil peroxidase gene. The promoter is useful for manipulating expression of heterologous proteins such as murine or human major basic proteins, eosinophil peroxidase, human granule ribonuclease, ribozyme, cell toxin and reporter proteins such as beta-galactosidase, within eosinophils. Transgenic animals are useful producing large quantities of eosinophils and as animal models for pulmonary pathologies such as asthma, using eosinophil-specific expression of transgenes. Discovery of the promoter is advantageous because eosinophil-specific expression of proteins is not toxic to the eosinophil and absence of eosinophils does not affect survival of the

Novel polynucleotide constructs comprising at least two repeats of a hypoxia response element useful for driving expression of nucleic acids of interest in a cell under hypoxic conditions

Example 21; Page 109; 155pp; English.

This invention describes novel polymuclectide comprising at least 2 repeats of a hypoxia response element (HRE), where the hypoxia-inducible factor (HIE) consensus binding sites within each of the 2 repeats are separated by a spacer of at least 20 contiguous nucleotides. The products of the invention have vasotropic, cardiant, cytostatic and antiarthritic activity and can be used for gene therapy. The polymucleotides are useful for delivering nucleic acids of interest to mammalian cells. Lentiviral vectors are responsive to hypoxic agents and to agents that mind: vectors are responsive to hypoxic agents and to eagents the mind: typoxia. This regulation can be harnessed in vitro to enhance the production of the vector and can be used in vitro to regulate gene expression in response to a physiological signal. The vectors have utility in disease, where ischaemia, including hypoxia, is a feature, or gradiovascular disease, peripheral arterial disease, cancer and arthritis. The novel regulatory construct is capable of driving very high levels of transcription under normal oxygen conditions. The polynucleotide construct targets cells within a tumor mass that are under conditions of hypoxia without affecting normal surrounding tissue. This sequence represents a murine phosphoglycerate kinase (PGK) promoter OBhrel HRE binding site primer which is described in the method of the

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstriction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or cancers

Claim 18; Page 430; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergies, and/or inflammation. The ON can have antiinflammatory, antiallergies, useful for the treatment of diseases associated with inflammation.

"Useful for the treatment of diseases and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary bypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers such as leukaemias, lymphomas, carcinomas, and cancers such as leukaemias, lymphomas, breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONS break down with the relacence of expediences which activates adenosine receptors causing bronchoconstriction and inflammation. AAA22313 to AAA33212 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SED ID No:1 to 188, but the sequences differ from the previously named sequences. SEQ ID No:11 to 160 (AAA32321 to AAA32322) to AAA33232 to AAA33232 to AAA33232 to and then the last invention do not match we with their corresponding SEQ ID No: sequences given in the sequence listing. Corresponding SEQ ID No: sequences given in the sequence listing.

The present invention describes a new composition comprising an antisense oligomucleotide (OM) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergies, and/or inflammation. The ON can have antiinflammatory, antiallergies, and/or inflammation. The Compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of decoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA35313 to AAA55312 represent invention, which correspond to SEQ ID No:1 to 185, but the sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and sleep apnea syndrome. The genes (AAZ96611-633) and the proteins (AAX67698-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to identification of genes and proteins of adipose
differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA33323 to AAA33992) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences

The invention relates to antisense compounds, especially oligomucleotides, which are targeted to a nucleic acid encoding inducible oligomucleotides, which are targeted to a nucleic acid encoding inducible contervations of inducible nitric oxide synthase. The antisense compounds carportective, disorder and vascitopic activity. The antisense compounds control cective, disorder and vascitopic activity. The antisense coligomucleotides are useful for inhibiting the expression of inducible nitric oxide synthase in cells or tissues. In particular, the antisense coligomucleotides are useful for treating diseases or disorders associated with inducible nitric oxide synthase, e.g. diabetes, immunological disorder, cardiovascular disorder, neurological disorder or schaemia/reperfusion injury. The antisense oligomucleotides are also useful for research and disonseits. The present sequence is that of an antisense 2.O-methoxyethyl agamer oligomucleotide with a customorphicate backbone, a central "gap" region of ten nucleotides cresidues in the 2.-MOE wings are 5.-methoxyethyl) wings (cytidine cresidues in the 2.-MOE wings are 5.-methylcytidines) and targeted to human creating control of the control of the control of

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipsoriatic, ophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as psoriaeis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, and for treating and preventing such as kelolid, adhesion and hypertrophic or hypertrophic burn and contract of the state of t Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent scarring such as keloid, adhesion and hypertrophic or hyper scar. AAH57577 to AAH62099 represent sequences used in the exemplification of the present invention. Disclosure; Page 379; 408pp; English. kinases

```
The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, ophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, captubalmological, vulnerary, keraclotytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriatis, atopic dermatitis, atopic dermaticis, atopic dermaticis, atopic dermaticis.

Skin diseases such as psoriatis, atopic dermatitis, atopic dermaticis.

Skin diseases such as psoriatis, atopic dermatitis, atopic dermaticis, atopic dermaticis, atopic dermatosis, atoming the cannopathy, vireoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adheeion and hypertrophic or hypertrophic burn sequences used in the
Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel Corynebacterium glutamicum thrE gene (I). The invention also describes (1) an amino acid sequence that is derived from the nucleic acid sequence of (I) and is selected from two sequences of 489 amino acid sidven in the specification; (2) coryneform microorganisms transformed with (I); (3) production of L-threonine by culturing coryneform bacteria in which nucleotide sequences encoding the thrE gene (sic) are overexpressed; and (A) a process for producing (I). Coryneform bacteria that overexpress (I) are useful for producing L-threonine, which is useful in animal nutrition, human medicine and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The antisense compounds are useful for inhibiting the expression of human Akt-3 in human cells or tissues. They are also useful for modulating the expression of Akt-3, and for treating a human or an animal suspected of having, or being prone to, a disease or condition associated with Akt-3 expression. The antisense compounds may also be used as research reagents, in kits and in diagnostics, e.g. to elucidate the function of a particular gene or to distinguish between functions of various members of

The present invention describes isolated nucleic acids encoding secreted polypeptides, designated PROX polypeptides (i.e. a PRO polypeptide where X is an integer from 1 to 17). PROX polypeptides have cytostatic, amunomodulatory and reproduction activities, and can be used in gene therapy, and as PROX antagonists and PROX agonists. PROX polypeptides, nucleic acids and antibodises are useful in the manufacture of a medicament for treating a syndrome associated with a PROX associated disorder, e.g. a cell proliferation and/or differentiation disorder (e.g. cancer or immune associated disorders) and a gestational disease (e.g. pre-clampsia). They are also used for screening for a modulator of activity or of latency or predisposition to a PROX-associated disorder. AMF74412 to AAF7448 encode the specifically claimed human PROX polypeptides PRO1 to PRO17 given in AAB70531 to AAB70547. The present section of an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, PRO; PROX; cytostatic; immunomodulatory; reproduction;

The present invention describes isolated nucleic acids encoding secreted polypeptides, designated PROX polypeptides (i.e. a PRO polypeptide where is an integer from 1 to 17). PROX polypeptides have cytostatic, immunomodulatory and reproduction activities, and can be used in gene therapy, and as PROX antagonists and PROX agonists. PROX polypeptides, nucleic acids and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a PROX-associated disorder, e.g. a cell proliferation and/or differentiation disorder (e.g. pre-clampsia). They are also used for screening for a modulator of activity or of latency or predisposition to a PROX-associated disorder. PAF74432 to AAF74448 encode the specifically claimed human PROX polypeptides PRO1 to PRO17 given in AAB70531 to AAB70547. The present sequence represents a primer used in an example from the present
Nucleic acids encoding secreted polypeptides, designated PROX polypeptides, useful for treating a syndrome associated with a PROX-associated disorder, e.g. cancer -

This invention describes novel isolated, preferably recombinant, polypeptides (I) containing the amino acid sequence for human procalciorain (hpcT). The producte of the invention have antitumor, antisepsis and antimilammatory activity. (I) (also antibodies (Ab) raised against it) are used: (i) for diagnosis and treatment of tumors, sepsis and systemic inflammatory response syndrome, (ii) to raise Ab; (iii) for quantitative or qualitative detection and analysis, especially of hpcT and antibodies against it; (iv) as controls or standards for assays; and (v) for affinity chromatography. Isolated (I) can be produced inexpensively in large amounts by recombinant expression. Solutions of (I) that contain a polyethoxylated sterol ester have good storage stability. This sequence represents a PCR primer used in the
                                                                                                                                                                                                        ó
displaying increased membrane potential. The method involves contacting mitochondria with a conjugate molecule comprising a targeting molecule conjugated to a toxin, where the conjugate or targeting molecule selected accumulates in the mitochondria. The method is useful for diagnosis of Alzheimer's disease (AD), especially sporadic AD. The present sequence is a probe used in the method of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New, preferably recombinant, human procalcitonin, useful for diagnosis and treatment of sepsis, tumors and systemic inflammatory response

The invention relates to isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode. The nucleic acids and proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing in a patient's genome that affect the activity of gene 216 by expressing contactive proteins or to supplement the patients own production of Gene 216 proteins, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The nucleic acids assays to detect and quantitate the presence of similar nucleic acids assays to detect and quantitate the presence of similar nucleic acid sequences in samples and therefore which patients may be in need of ceptorative therapy. The Gene 216 protein may also be used as antigens in the production of antibodies against Gene 216 and in assays to identify modulators of Gene 216 expression and activity. The anti-Gene 216 antibodies may also be used as antigens of antibodies and the presence of Gene 216 and in assays to identify and additions of Gene 216 antibodies may also be used as diagnostic agents for detecting the presence of Gene 216 proteins in samples (e.g. procession and activity. The anti-Gene 216 antibodies may also be used as diagnostic agents for detecting the presence of Gene 216 proteins in samples (e.g. procession and activity. The anti-Gene 216 proteins in samples (e.g. procession and activity. The anti-Gene 216 proteins in samples (e.g. procession and activity. The anti-Gene 216 proteins in samples (e.g. procession and activity. The anti-Gene 216 proteins in samples (e.g. procession and activity. The protein and activity and any protein may also be used as diagnostic or agents for detecting the presence of Gene 216 proteins in samples (e.g. pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     prevented, diagnosed and/or treated by the above methods include, for example asthma, obesity and inflammatory bowel disease. The present sequence is that of a Gene 216 related primer used in examples of the invention. The primers are used in the physical mapping of the gene (ABZ72067-ABZ72089), polymorphism identification using single strand conformational polymorphism (SSCP) analysis (ABZ72091-ABZ72184), sequencing (ABZ72185-ABZ72268) and genotyping (ABZ72317-ABZ72362).
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, Gene 216, chromosome 20p13-p12, antiasthmatic; anorectic; antiinflammatory; gastrointestinal; gene therapy; vaccine; asthma; obesity; inflammatory bowel disease; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated genes (Gene 216) from human chromosome 20p13-p12 and t
proteins they encode, useful for the prevention, diagnosis and
treatment of asthma, obesity and inflammatory bowel disease

Sequence 18 BP; 2 A; 7 C; 3 G; 6 T; 0 other;

0; ; 0 The invention relates to a truncated neublastin polypeptide comprising an amino acid terminus that lacks one or more amino-terminal amino acids of a mature neublastin polypeptide. The polypeptides and nucleic acids are useful for treating neurodegenerative disorders such as ischemic neuronal damage, traumatic brain injury, peripheral neuropathy, neuropathic pain, Alzheimer's disease, Huntington's disease, Parkinson's disease, amyotrophic lateral sclerosis, memory impairment, diabetes, renal diseases, or glaucoma by moderating metabolism, growth, differentiation or survival of a nerve or neuronal cell. This polynucleotide sequence is Nootropic; neuroprotective; antiparkinsonian; anticonvulsant; analgesic; tranquiliser; antidiabetic; ophthalmological; neurodegenerative disorder; neublastin; ischemic neuronal damage; traumatic brain injury; diabetes; peripheral neuropathy; neuropathic pain; Alzheimer's disease; glaucoma; Huntington's disease; parkinson's disease; glaucoma; memory impairment; renal disease; PCR; primer; ss. Reelin protein CR-50 epitope region, useful for diagnosis and treatment
                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated acyl coenzyme A thioesterase (ACH) encoding nucleic acid, encoding one of ACH1, ACH2, ACH4 or ACH5. ACH enzymes have a role in lipid oxidation, regulation of Coenzyme A pools and in fatty acid metabolism. Also include are a host cell transfected with the nucleic acid, a transgenic plant transfected with the nucleic acid, a transgenic plant transfected with the nucleic acid is useful for altering a phenotype of a plant and for making a transgenic plant, by transfecting the plant tissue with the ACH nucleic acid under conditions such that a transgenic plant is generated. The ACH nucleic acid under conditions such that a transgenic plant is generated. The ACH nucleic acid is also useful for producing variants of acyl-CoA thioesterases. The present sequence is a PCR primer used to amplify Arabidopsis ACH4 encoding sequences.
                                                                                                                                                                                                                                                                                         Novel acyl coenzyme A thioesterase gene useful for altering a phenotype of a plant, making a transgenic plant and for producing variants of acyl-CoA thioesterases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mouse, reelin protein CR-50 epitope region, elucidation, neuron;

The method is used for diagnosis and prognosis of adverse toxic responses in individuals. The present sequence is a human sequence used to demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Toxicological diagnosis, useful for diagnosis and prognosis of adverse reactions, based on effect of test compounds on methylation status of selected genes, involves determining changes in DNA methylation status
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present invention relates to a method of toxicological diagnosis,

                                                                                                                                      g
The present invention describes the mouse reelin protein CR-50 epitope region, which contains the CR-50 antibody recognition site and is free from F-spondin domains and repetitive sites. Also described are: (1) an expression vector comprising a polymucleotide encoding a reelin protein epitope region; (2) host cells with transfected the expression vector; (3) polymeptides prepared by culture of the host cells; and (4) polymucleotides comprising the 351 base sequence given in AB1640165 which encodes the 117 amino acid sequence given in AB306244; and (5) use of the polymucleotide for diagnosis and/or treatment of diseases caused by abnormal positioning of neural cells, and stimulation of association of reelin protein. The mouse reelin protein CR-50 epitope region has neuroprotective activity, and can be used in the diagnosis and treatment of neurons. The present sequence represents a PCR primer for the mouse reelin protein CR-50 epitope region, which is used in an example from

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (AB10512-AB151809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 genotypes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a typing kit for judging human leukocyte antigen (HIA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HIA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primars for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HIA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, diagnosis of genetic diseases and identifying individuals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them -

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABL50512-ABL51809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of pancreas tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, langue for transplantation e.g. of bone marrow, kidney, liver, diagnosis of genetic diseases and identifying individuals.
                                                                                                                                                                                                 genotypes

                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonuclectides (AB10312-AB131809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by decrmining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals.
                                                                                                                                                                            Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0.9%; Score 12.8; DB 1; Length 18; 87.5%; Pred. έ

Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when of individuals e.g. by detern transplanting between them -

Claim 10; Page 206; 345pp; Japanese.

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABL30512-ABL31809) originating in the sequences of

The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them -

The invention described a method of detecting variation in growth hormone (GH1), and therefore GH dysfunction in an individual. The method comprises comparing the nucleotide sequence of GH1 gene obtained from the test sample with a standard human GH1 gene sequence, in order to identify variation (GH1 variant). The method is useful in screening patients for treating irregularities or producing variant proteins for treating irregularities, and for the early detection and appropriate clinical management of familial GH deficiency. The GH1 variants are useful in chrappentic, diagnostic or detection method, particularly for determining binding defects and susceptibility to a disease such as diabetes, obesity or infection; for treating acromegaly or gigantism conditions associated with sodium and water retention, metabolic conditions associated with sodium and water retention, metabolic syndromes, mood and sleep disorders; diagnosing GH dysfunction and etectuling genetherapy or protein therapy. The GH1 variants are sepcially useful in gene therapy or protein therapy. The GH1 or GH variant may also be used in the preparation of a medicament, diagnostics composition or the used in the etiology of short stature; identifying of the mode of mutations in the etiology of short stature; identifying of the mode of metations in the structure and function of the GH molecule and development of arapid diagnostic tests for inherited GH deficiency. This sequence is the GH1 gene locus control region (LCR) specific primer, LCR25, used to amplify
Detecting growth hormone variants (GH1), useful in screening patients for growth hormone irregularities, comprises comparing the nucleotide sequence of a GH1 gene from a test sample with that of a standard sequence of the human GH1 -

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates, (b) a primer designed based on the chromosome marker or sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant corresponding to the marker is equence; (d) the multiwell plates containing the clones having said marker sequence; (d) the order of the marker is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell containination Nos. are mixed respectively in each wells of Inngitudinal and lateral directions; (f) the mixed clones are cultured and the cashltant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell cash detected from the amplified products; (h) the clones in the multiwell cash detected from the amplified products; (h) the clones in the multiwell cash detected from the amplified products; (h) the clones in the multiwell cash detected from the amplified products; (h) the clones in the multiwell cash detected from the amplified products; (h) the clones in the multiwell cash detected from the amplified products; (h) the clones in the multiwell cash detected from the multiwell cash detected from the

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker of sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant containing the clones having said marker sequence; (d) the order of plates containing the clones having said marker sequence; (d) the order cof the maximum in the specified discrimination Nos. to array the multiwell cof the maximum in the specified discrimination Nos. to array the multiwell and lateral directions; (f) the mixed clones are cultured and the clones in the multiwell plates of the specified and lateral directions; (f) the mixed clones are cultured and the containing the amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL43937 to ABL4332 represent profession of the contain the analysis of plates; and plates are specified for microarray is useful for gene analysis. ABL43937 to ABL4333 to ABL43634 enemity of analysis. specifically claimed for use in the present invention

(I) is useful for inhibiting the expression of Cyclin D2 in cells or tissues in vitro. (I) is thus useful for treating disease associated with Cyclin D2 expression. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This sequence represents human cyclin D2 inhibition associated oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention relates to novel nucleic acids and proteins for accolactate synthase (ALS) regulatory regions, alpha-tubulin promoter, polyketide synthase (PKS) promoter and fatty acid desaturase promoter from Thraustochytriales microorganisms. The nucleic acids of the invention are useful for transforming Thraustochytriales microorganisms or the foreign nucleic acids in a Thraustochytriales. The present sequence is a primer which is used to detect the presence of pUNBZEO11-2 sequences in Schizochytrium species. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for detecting a skin stimulation effect by using a test substance. The method comprises contecting a test substance with epithelial cells, and detecting the increase or decrease of calcium ion concentration in the cells. The method is useful as a
                                                                                                                                                            New nucleic acid molecule, useful for transforming Thraustochytriales microorganisms or the foreign nucleic acids in a Thraustochytriales
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Receptor-based method for detecting skin stimulation effect useful in screening analgesics, antiinflammatory agents and inhibitors on epidermal abnormality, comprising measuring changes in calcium ion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Dermatological; analgesic; antiinflammatory; epithelial cell; skin; vallinoid receptor; VR1; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel isolated nucleic acid, gene 216, identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single nuclectide polymorphisms (20PP's) which may be used as markers for disease susceptibility or severity. The nucleotides of the invention may have antiasthmatic, attinfiammatory or anorectic activities and may be used in gene therapy. The nucleic acids, antibodies or its fragments are useful for diagnosing, preventing or treating a discretz, such as respiratory diseases (e.g. asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease or adult respiratory distress syndrome, obstructive pulmonary disease or adult respiratory distress syndrome, obstructive nucleic acids are also useful for identifying increased susceptibility of a subject to the disorders mentioned. The nucleic acids can also useful for the recombinant production of disorder-associated templates for the recombinant production of disorder-associated templates for the recombinant production of disorder-associated peptides, for chromosome and gene mapping, or for tissue distribution studies. The present sequence represents a gene

The present invention describes a method (M1) for regulating expression of a nucleic acid sequence in a primary cell comprising providing a nucleic acid binding polypeptide capable of binding to the nucleic acid sequence and contacting the nucleic acid binding polypeptide (I) and binding polypeptide (I) and in a nucleic acid sequence in the primary cell. Also described: (I) a nucleic acid sequence in a primary cell; (2) a primary cell (II) comprising an exogenous nucleic acid binding polypeptide; (2) a primary cell (II) comprising an exogenous nucleic acid binding polypeptide or the primary cell and a carrier or diluent; (4) treating (M2) or preventing a disease, or (5) expression (II) comprising maxy cell. (I) has cytostatic and nephrotropic polypeptide in a primary cell. (I) has cytostatic and nephrotropic treating or preventing a disease e.g., kidney failure or cancer. The present sequence represents an oligonocleotide which is useful the
                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Regulating expression of a nucleic acid sequence in a primary cell for treating or preventing a disease e.g., cancer, comprises contacting the nucleic acid binding polypeptide with the nucleic acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gene regulation; expression; nucleic acid binding protein; cytostatic; nephrotropic; gene therapy; kidney failure; cancer; ss.
dermatological agent in the screening of analgesics, antiinflammatory agents and inhibitors on epidermal abnormality. The current sequence represents a rat vallinoid receptor (VRI) related PCR primer sequence

This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABR099989, ABR00010-ABH99989 and ABL001010-ABH99989 and NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fip.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                    SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosline methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal respiratory, oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF0010-ABH99999 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this parent did not form part of the printed specification, the unvention. Appendigued the oligoners are also used for detains the oligomers are also used for detains described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
The invention comprises the amino acid and coding sequence of the human interleukin 12A (II-12A) protein. Specifically the invention relates to the identification of polymorphisms within the human (II-12A) gene sequence. The polymorphisms identified in the human II-12A gene sequence are useful in studying the expression and function of II-12A gene sequence screening drugs for the treatment of disorders such as AIDS, malaria, tuberculosis and cancer. The II-12A polymorphisms may be used to haplotype and genotype the II-12A gene of an individual. The II-12A DNA sequences of the invention can be used to create transgenic animals for setudying expression of the II-12A isogenes in vivo. The present DNA sequence represents a human interleukin 12A (II-12A) gene allele specific oligonucleotide primer.
                                                                                                                                      Human interleukin 12A (IL-12A) allele specific oligonucleotide primer 6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New interleukin 12A (IL-12A) gene polymorphic variants, for studying the expression and function of IL-12A and screening candidate drugs for

```
The invention comprises the human lysosomal acid phosphatase 2 (ACP2) nucleic acid and protein sequences. Specifically, the invention relates to the discovery of 22 novel polymorphic sites within the APC2 gene. The invention also comprises methods for haplotyping and genotyping the ACP2 gene in an individual. The ACP2 gene (located on chromosome 11) encodes a CP sposomal-specific enzyme that catalyses the hydrolysis of critically important in the treatment of Hodgkin's protein are pharmaceutically important in the treatment of Hodgkin's corporation are pharmaceutically important in the treatment of Hodgkin's corporation of the invention are useful in haplotyping the ACP2 gene. Copymorphisms of the invention are useful in haplotyping the ACP2 gene. ACP2 haplotyping is useful in validating ACP2 as a target (and designing disease and acid phosphatase deficiency.) The ACP2 gene polymorphisms of the invention are useful in the production of a transpencin acids of the invention are useful in the production of a transpencin and hich expresses ACP2 protein. The ACP2 protein and nucleic acids of the invention are useful in the production of allele-specific oligonucleotides designed to genotype each of the ACP2 protein. The ACP2 uncleic acids ABL36329-ABL3634 represent claimed ACP2 allele-specific process. Nucleic acids ABL36321-CCC ABL3634 represent claimed ACP2 allele-specific process. Nucleic acids ABL36321-CCC ABL36354 represent claimed ACP2 allele-specific process. Nucleic acids ABL36321-CCC ABL36354 represent claimed ACP2 allele-specific process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0.9%; Score 12.6; DB 1;

```
The invention relates to a method of sequential consensus region-directed amplification for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease diagnosis and gene analysis. The present sequence is oligo dT PCR primer used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                        Sequential consensus region-directed amplification for sorting mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples, useful for disease diagnosis and gene analysis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a truncated neublastin polypeptide comprising an
                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New truncated neublastin polypeptides lacking one or more amino-terminal amino acids of a mature neublastin polypeptide useful for treating neurodegenerative disorders, e.g. peripheral neuropathy,
                                                                                                             This primer was used for reverse transcription of RNA isolated from mouse tumour lines L-RT101 (epidermal tumour cell line) and H-TX (spontaneously transformed liver line). It was also used as the reverse primer in PCR amplification of the resulting cDNA. Primers P1 and P2 (see AAX87333) reproducibly detected differential expression of a gene between 1,10-phenanthroline (OP)-treated and OP-nontreated L-RT101 and H-Tx cells. An OP-inducible clone was oorresponding to the mouse sensitive to apoptosis gene (SAG): SAG is a redox-sensitive, haem-binding protein domain that promotes cell growth, protects cells from apoptosis, scavenges oxygen radicals and can be used for the reversion of a tumour phenotype.
                               SAG: Sensitive to Apoptosis Gene and related proteins, useful for promoting cell growth and protecting cells against apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                                                                                                                                                                                                                                      Length 18;

a mature neublastin polypeptide. The polypeptides and nucleic acids are useful for treating neurodegenerative disorders such as ischemic neuronal damage, traumatic brain injury, peripheral neuropathy, neuropathic pain, Alzheimer's disease, Huntington's disease, Parkinson's disease, amyotrophic lateral sclerosis, memory impairment, diabetes, renal diseases, or glaucoma by moderating metabolism, growth, differentiation or survival of a nerve or neuronal cell. This polymucleotide sequence is a neublastin PCR primer of the invention. acid terminus that lacks one or more amino-terminal amino acids of 8X88888888XX

Novel polynucleotide of the endothelin/endothelin converting enzyme/receptors of endothelin and endothelin converting enzyme signaling system associated with cardiovascular disease, useful for signaling system rating the disease 

Claim 1; Page 63; 190pp; English.

The invention describes a polymucleotide (I) of the endothelin (EDN)/endothelin converting enzyme (ECB)/receptors of EDN and ECB (EDNR) signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I) or (II) is useful for producing cells capable of expressing a molecular variant polypeptide which is associated with a cardiovascular disease. (II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing a molecular variant gene comprising (I) is useful for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product, or for identifying and obtaining an inhibitor of the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE

ö signaling system or its gene product. The isolated proteins and polynucleotides encoding them are useful for preparation of a pharmacutical composition for treating a cardiovascular disease such as coronary heart disease, hypertension, atherosclerosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial hypercholesterolaemia. The gene or a polynucleotide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers, for creating a transgenic animal and in creation of a solid support comprising polynucleotides, genes, vectors, polypeptides, antibodies or host cells of the invention. This sequence represents a PCR primer used to identify single nucleotide polymorphisms in DNA encoding cardiovascular regulator proteins of the EDN/EC/EDNR signaling pathway. Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient

Claim 4; Page 94; 218pp; English

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fit-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (fik-1) (e.g. tumour

These proteins are useful in the modulation of ligand dependent transcriptional factor activity. The cells, mutant ERalpha and the polynucleotide encoding it may be used in assays for qualitatively analysing an activity for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ligand dependent transcriptional factor; oestrogen receptor; ER; glucocorticoid receptor protein; GR; mineralocorticoid receptor protein; MR; peroxisome proliferator-activated receptor protein; PPAR; progreterone receptor protein; PR; pregname X receptor protein; PXR; thyroid hormone receptor protein; TR; vitamin D receptor protein; VDR; transactivation; ERalpha; breast cancer; PCR primer; probe; ss.
angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ligand dependent transcriptional factors, nucleic acids encoding them and cells comprising them and a specified reporter gene, useful for screening agents for the treatment of breast cancer -

Nucleic acids encoding transmembrane protein TRPC7 expressed in brain and homologous to transient receptor potential protein useful in the treatment of associated diseases such as periodic psychosis

Example 7; Page 39; 77pp; Japanese.

The invention relates to the isolation of a nucleic acid (AAA11284) coding for a transmembrane protein TRPC7 (AAY92944) which is expressed in brain and is homologous to transient receptor potential (TRP) protein. This suggests that the TRPC7 protein may have a calcium channel function. The genomic sequence has been shown to contain 31 introns. This sequence represents an exon/intron junction from the genomic TRPC7 sequence. The DNA and protein can be used in the diagnosis and treatment of disorders associated with TRPC7, especially the screening, monitoring and treatment (by gene therapy) of periodic psychosis, which appears to be associated with mutations in the TRPC7 gene.

New antisense compound targeted to nucleic acid encoding mitogen-activated protein kinase 4, useful for treating immunologic disorder, inflammatory disorder or cancer

The present invention relates to antisense compounds, compositions and methods for modulating the expression of MEKK4 (also referred as mitogenactivated protein kinase kinase 4; MAPZKK4; MAP Three kinase 1; MAPZEK kinase kinase 4; MAPZKK4; MTI. The antisense cligos are useful for inhibiting the expression of MEKK4 in cells or tissues. They are also with MEKK4 such as immunological, inflammatory, hyperproliferative disorder or cancer. Sequences of the invention are also useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. They are also useful in antisense therapy. The present sequence is an antisense oligomoclade targetted to human MEKK4 DNA. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                         Sequence 20 BP; 2 A; 4 C; 10 G; 4 T; 0 other;

cancer

Claim 1; Page 74; 116pp; English.

The present invention relates to a method of amplifying and determining target mutant Ras sequences in a DNA sample, involving the use of a thermostable restriction enzyme and primers shown in AAL47705-AAL47771. The method used is designated restriction mediated selection polymerase chain reaction (REMS-PCR). The method can be used to detect H-ras, K-ras and N-ras mutations, which may lead to cancer. The present sequence is a PCR primer useful in the method of the invention.

Sequence 21 BP; 3 A; 9 C; 6 G; 3 T; 0 other;

The present invention relates to new NOVX polypeptides. The invention is useful for treating or preventing a NOVX-associated disorder such as cardicomyopathy or atherosclerosis, where the disorder is related to cell signal processing and metabolic pathway modulation in a subject, preferably human. The invention is also useful for treating metabolic disorders (e.g. obesity), diabetes, inflectious disease, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease), immune

The invention is used to detect presence or risk of myotonic dystrophy, myocardial infarction or a condition associated with muscle damage or dysfunction. This sequence represents a reverse transcriptase PCR primer used to isolate cDNA encoding exon 16 of the novel Myotonic dystrophy protein kinase DMPK isoform studied in the

for the treatment of inflammatory bowel disease (IBD) or related disease that treatment of inflammatory bowel disease (IBD) or related disorders that comprises administering a compound that up-regulates the function of IL-9 or the IL-9 receptor. A method for monitoring humans or fragments), by evaluating IL-9 levels in samples taken at different times, and a method for screening for cells expressing the IL-9 receptor. Or the IL-9 receptor and a method for screening for cells expressing the IL-9 receptor to by detecting binding of a specific ligand are also provided. Compounds up-regulating the function of IL-9 receptor can be used the rapeutically (in pharmaceutical compositions, optionally with acceptable carriers) to treat IBD and other related inflammatory disorders. IBDs (which include Crohn's diseases and chronic non-specific inflammatory response to environmental stimuli. Immune responses to antidems are dominated by a Thl or TL2 responses, and evidence suggests that IBDs are dominated by a Thl mediated, antigen induced, inflammatory response. Other related Thl mediated diseases include multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences shown in AAV41331 to AAV41340 represent exon specific primers

the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatorial arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes nucleic acid molecules which modulate
                                            Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flt-1; ADM; hammerhead ribozyme; halirpin ribozyme; oleavage; tleavage; tleavage; trumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Wheat; oat; viviparous 1; VP1; afVP1; taVP1; maize; detection; PHS; pre-harvest sprouting; dormant; germination; crop plant; primer; ss.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBB399), a sequence having 65% sequence identity to (SI), (SI), acids (SI), applicably conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) concoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples
                                                                                                                                                                                                                                                                                                                                                                                                                                           of the invention.
Note: The present sequence did not form part of the printed
specification, but is based on sequence information supplied to Derwent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, POSHL 1, SH3 domain, POSH-like signalling protein 1; oncogene;

                                                                                                                                                                                                                                                              The present sequence represents a primer for the wheat viviparous 1 (VP1) gene, which keeps mature seeds dormant and inhibits germination. The present invention describes genes which are homologues of the maize Viviparous 1 gene, obtained from oat Avena fatua and wheat which encode polypeptides designated afVP1 and taVP1 respectively. The VP1 activity maintain or impose sufficient intensity and duration and can be used to avoid pre-harvest sprouting (PHS) before harvest. The products can be used in the production of transformed crop plants having desirable primary or secondary dormancy, or after-ripening properties, and in particular may be resistant to PHS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, POSHL 1, SH3 domain, POSH-like signalling protein 1, oncogene, Rho GTPase; signal transduction, gene expression, cancer, vaccine;

The sequences given in AAT80211-382 represent synthetic oligonucleotides which are complementary to a portion of the 5' untranslated region (UTR) of hepatitis C virus (HCV). These sequences may be used in a pharmaceutical composition for the control or prevention of HCV infection. They may be used to inhibit replication or expression of HCV or for detecting the presence of HCV in a sample. They may be used to inhibit HCV replication in a cell and are therefor useful in the treatment of HCV infections such as chronic and acute hepatitis and hepatocarcinoma. This oligo was used in a luciferase assay to determine whether it binds sucessfully to its target.
                                                                                                                                                                                                                                                                                                                              Oligo:nucleotide(s) complementary to HCV 5' untranslated region - used in the treatment and detection of HCV infection, esp. hepatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hepatitis C virus; HCV; hepatocyte infection; non-A hepatitis; non-B hepatitis; acute hepatitis; chronic hepatitis; hepatocellular carcinoms; virucide; cytostatic; antisense therapy; gene therapy; ss; DNA-RNA hybrid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SL, ABBB399), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                               Novel human SH3 domain (POSH)-like signalling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Complementary; 5' untranslated region; UTR; hepatitis C virus; HCV inhibition; replication; expression; detection; chronic hepatitis; acute hepatitis; hepatocarcinoma; ss.

The present invention relates to human oligonucleotides comprising a single nucleotide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotides can be used in forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Endothelin; EDN; endothelin converting enzyme; ECE; endothelin receptor; EDNR; signaling system; cardiovascular disease; coronary heart disease; hypertension; atherosclerosis; anglogenesis; fatty acid metabolism; diabetes; familial hypercholesterolaemia; forensic marker; transgenic animal; solid support; cardiovascular regulator; SNP; single nucleotide polymorphism; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a polynucleotide (I) of the endothelin (EDNR) fendothelin converting enzyme (ECR)/receptors of EDN and BCE (EDNR) signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, BCE or EDNR (II) or a vector (III) expressing (I) or (II) is useful for producing cells capable of expressing a molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   enzyme/receptors of endothelin and endothelin converting enzyme signaling system associated with cardiovascular disease, useful for
                                                                                  New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly disease, and also in forensics and paternity testing -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Endothelin converting enzyme 1 (ECE-1) SNP detection primer #63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel polynuclectide of the endothelin/endothelin converting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                     The invention describes synthetic oligonucleotides complementary to a portion of the 5' untranslated region of hepatitis C virus. The oligonucleotides may be used in methods for controlling, preventing, and treating hepatitis C virus infection, in antisense technology and gene therapy, and of detecting the presence of hepatitis C virus in a sample. Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded RNA virus which infects hepatocytes. HCV is the major cause of non-A, non-B, acute and chronic hepatitis, and has been associated with hepatocellular carcinoma. The invention describes methods and kits for inhibiting replication of HCV, inhibiting the expression of HCV nucleic acid and protein, and for treating HCV infections. This sequence represents a synthetic DNA-RNA hybrid oligonucleotide used for inhibiting HCV replication and expression of HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; single nucleotide polymorphic; SNP; forensic science;

Gaps

. 0

variant polypeptide which is associated with a cardiovascular disease.

(II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing

a molecular variant gene computating (I) is useful for identifying and

obtaining a pro-drug or drug capable of modulating the activity of a

molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system

or its gene product, or for identifying and obtaining an inhibitor of

the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE

signaling system or its gene product. The isolated proteins and

colymclectides encoding them are useful for preparation of a

pharmaceutical composition for treating a cardiovascular disease such as

coronary heart disease, hypertension, atherosclerosis, or related to

abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial

CC abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial

CC abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial

CC abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial

CC abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial

CC abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial

CC abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial

CC compusising polynuclectides, gene or a polynucleotide such according to compusising polynucleotides, genes, vectors, polypeptides, antibodies or

CC compusising polynucleotides, genes, vectors, polypeptides, antibodies or

CC compusising polynucleotides, genes, extors, polypeptides, antibodies or

CC compusising polynucleotides, genes, genes, expresents a PCR primer used

CC cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway. Endothelin; EDN; endothelin converting enzyme; ECE; endothelin receptor; EDNR; signaling system; cardiovascular disease; coronary heart disease; hypertension; atherosclearosis; andiogenesis; fatty acid metabolism; diabetes; familial hypercholesterolaemia; forensic marker; transgenic animal; solid support; cardiovascular regulator; SNP; single nucleotide polymorphism; PCR; primer; ss. Novel polynucleotide of the endothelin/endothelin converting enzyme/receptors of endothelin and endothelin converting enzyme signaling system associated with cardiovascular disease, useful

Example 6; Page 63; 190pp; English.

the disease

```
signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I) or variant polypeptide which is associated with a cardiovascular disease.

Cr variant polypeptide which is associated with a cardiovascular disease.

(II), (III), the EDN ECE or EDNR polypeptide, or a cell expressing or a molecular variant gene comprising (I) is useful for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and control of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and pharmaceutical composition for treating a cardiovascular disease such as coronary heart disease, hypertension, atherosclerosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial hypercholesterolaemia. The gene or a polymuclectide fragment of the EDN/EDNR signaling system are useful as forensic markers, for creating a transgenic animal and in creation of a solid support creating a transgenic animal and in creation of a solid support comprising polymuclectides, antibodies or comprising polymuclectides, antibodies or comprising polymuclectides, antibodies or comprising polymuclectides, antibodies or comprising polymuclectides, and pharence represents a PCR primer used
                                                                                                                                                                                                                                                                                                                                                                                                    to identify single nucleotide polymorphisms in DNA encoding cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, variant thrombospondin 1, variant thrombospondin 4, SNP; polymorphism, vascular disease, coronary artery disease, forensics; myocardial infarction, atherosclerosis, stroke, venous thromboembolism;

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, mycoardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification. Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis. Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases

Claim 3; Page 29; 72pp; English.

The intention describes an enzymatic muclear acta molecule (1) wince the regulates expression of a sequence encoding a subunit of muclear factor kappa B (NFKB), where (1) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (1) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG2+ The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodias, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, gemittabine or radiation therapy. The enzymatic and antisense nucleic cond molecules are also useful for treating inflammatory disease such as necessity, autoimmune disease, lupus, multiple solerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury central nervous system (CNS) and myocardial), glomerulosaphitis, especial are electroned in the propertion inflammatory bowel disease or section method and propertion inflammatory bowel disease or invention describes an enzymatic nucleic acid molecule (I) which down infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule.

                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel short interfering RNA (SiRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HRR2, K-RSB, H-RBS, N-RBS, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and runti-rrenamatic activity. The nucleic acid molecules are useful for reducing HRB2, K-RBS, H-RBS, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
